Business Problem Statement

AtliQ — HR Attendance & Workforce Intelligence Project

1. Background

AtliQ tracks employee attendance in manual monthly Excel sheets (one tab per month, one row per employee, one column per day, with coded statuses such as P, WFH, PL, SL, LWP, WO). The data covers April–June 2022 and about 74 distinct employees. The sheets record what happened, but they are hard to read as a whole, so HR has no quick view of attendance and work-from-home patterns.

2. The Business Problem

HR leadership cannot answer basic workforce questions quickly or consistently:

- What share of working days are employees actually present, working from home, or on sick leave?
- Is attendance getting better or worse month to month, and are there specific weeks or days that dip?
- Does attendance follow a weekday pattern (for example, a weaker Friday) that should shape planning and scheduling?
- Which employees show unusually low presence or heavy WFH usage, so HR can follow up with a conversation rather than guesswork?
- Is leave usage (paid, sick, unpaid) within a healthy range?

3. Why It Matters

- **Capacity planning:** project managers need to know how many people are really available on a given day.
- **Policy decisions:** WFH and on-site expectations should rest on observed behaviour, not anecdote.
- **Early warning:** rising unpaid leave or falling presence can signal engagement or burnout problems.
- **Efficiency:** hand-built monthly summaries cost HR time and risk inconsistent figures.

4. Data Challenges

- Attendance is split across separate monthly tabs with wide, date-per-column layouts that are not analysis-ready.
- Statuses are short codes (including half-day variants) that need an attendance key to interpret.

- Weekly offs (WO) must be excluded or they inflate the denominator and understate presence.
- Some employee codes are shared by more than one name, and late-June rows are only partly filled, so data needs careful scoping.

5. Objectives

- Consolidate the monthly sheets into one clean, analysis-ready attendance table.
- Define standard KPIs: Presence %, WFH %, Sick Leave % and Total Employee Count.
- Build an interactive Power BI dashboard with trend lines, a day-of-week view and filters by month, weekday and employee.
- Surface insights and recommendations HR can act on.

6. Key Questions the Dashboard Answers

Question	Dashboard element
How present is the workforce overall?	Presence % card + trend area chart
How much WFH, and when?	WFH % card + trend + weekday table
Is sick leave abnormal?	SL % card + trend + weekday table
Who is an outlier?	Employee table (Presence %, SL %, WFH %)
What happened on a given day?	Daily detail matrix + month / weekday slicers

7. Success Criteria

- HR can see headline attendance KPIs in one glance and filter by month, weekday and employee.
- The same KPI definitions are used every month, so figures are comparable.
- Attendance risks and patterns are identifiable without opening the raw sheets.
